Suppose there is a person.

Race	Income	Child	Insurance
white	high	no	?

Test set

Race	Income	Child	Insurance
black	high	no	yes
white	high	yes	yes
white	low	yes	yes
white	low	yes	yes
black	low	no	no
black	low	no	no
black	low	no	no
white	low	no	no

Training set

Decision tree

# Applications

---

- Insurance
  - According to the attributes of customers,
    - Determine which customers will buy an insurance policy
- Marketing
  - According to the attributes of customers,
    - Determine which customers will buy a product such as computers
- Bank Loan
  - According to the attributes of customers,
    - Determine which customers are “risky” customers or “safe” customers

# Applications

---

- Network
  - According to the traffic patterns,
    - Determine whether the patterns are related to some “security attacks”
- Software
  - According to the experience of programmers,
    - Determine which programmers can fix some certain bugs

Classification And Regression Trees

# Entropy

---

- Example 1
  - Consider a random variable which has a uniform distribution over 32 outcomes
  - To identify an outcome, we need a label that takes 32 different values.
  - Thus, 5 bit strings suffice as labels

# Entropy

---

- **Entropy** is used to measure how informative is a node.
- If we are given a probability distribution  $P = (p_1, p_2, \dots, p_n)$  then the **Information** conveyed by this distribution, also called the **Entropy** of  $P$ , is:  
$$I(P) = - (p_1 \times \log p_1 + p_2 \times \log p_2 + \dots + p_n \times \log p_n)$$
- All logarithms here are in base 2.

# Entropy

---

- For example,
  - If  $P$  is  $(0.5, 0.5)$ , then  $I(P)$  is 1.
  - If  $P$  is  $(0.67, 0.33)$ , then  $I(P)$  is 0.92,
  - If  $P$  is  $(1, 0)$ , then  $I(P)$  is 0.
- The **entropy** is a way to measure the amount of information.
- The smaller the entropy, the more informative we have.

# Entropy

$$\text{Info}(T) = -\frac{1}{2} \log \frac{1}{2} - \frac{1}{2} \log \frac{1}{2} = 1$$

For attribute Race,

$$\text{Info}(T_{\text{black}}) = -\frac{3}{4} \log \frac{3}{4} - \frac{1}{4} \log \frac{1}{4} = 0.8113$$

$$\text{Info}(T_{\text{white}}) = -\frac{3}{4} \log \frac{3}{4} - \frac{1}{4} \log \frac{1}{4} = 0.8113$$

$$\text{Info}(\text{Race}, T) = \frac{1}{2} \times \text{Info}(T_{\text{black}}) + \frac{1}{2} \times \text{Info}(T_{\text{white}}) = 0.8113$$

$$\text{Gain}(\text{Race}, T) = \text{Info}(T) - \text{Info}(\text{Race}, T) = 1 - 0.8113 = 0.1887$$

For attribute Race,

$$\text{Gain}(\text{Race}, T) = 0.1887$$

Race	Income	Child	Insurance

- Bayesian Belief Network
  - Do not have independent assumption

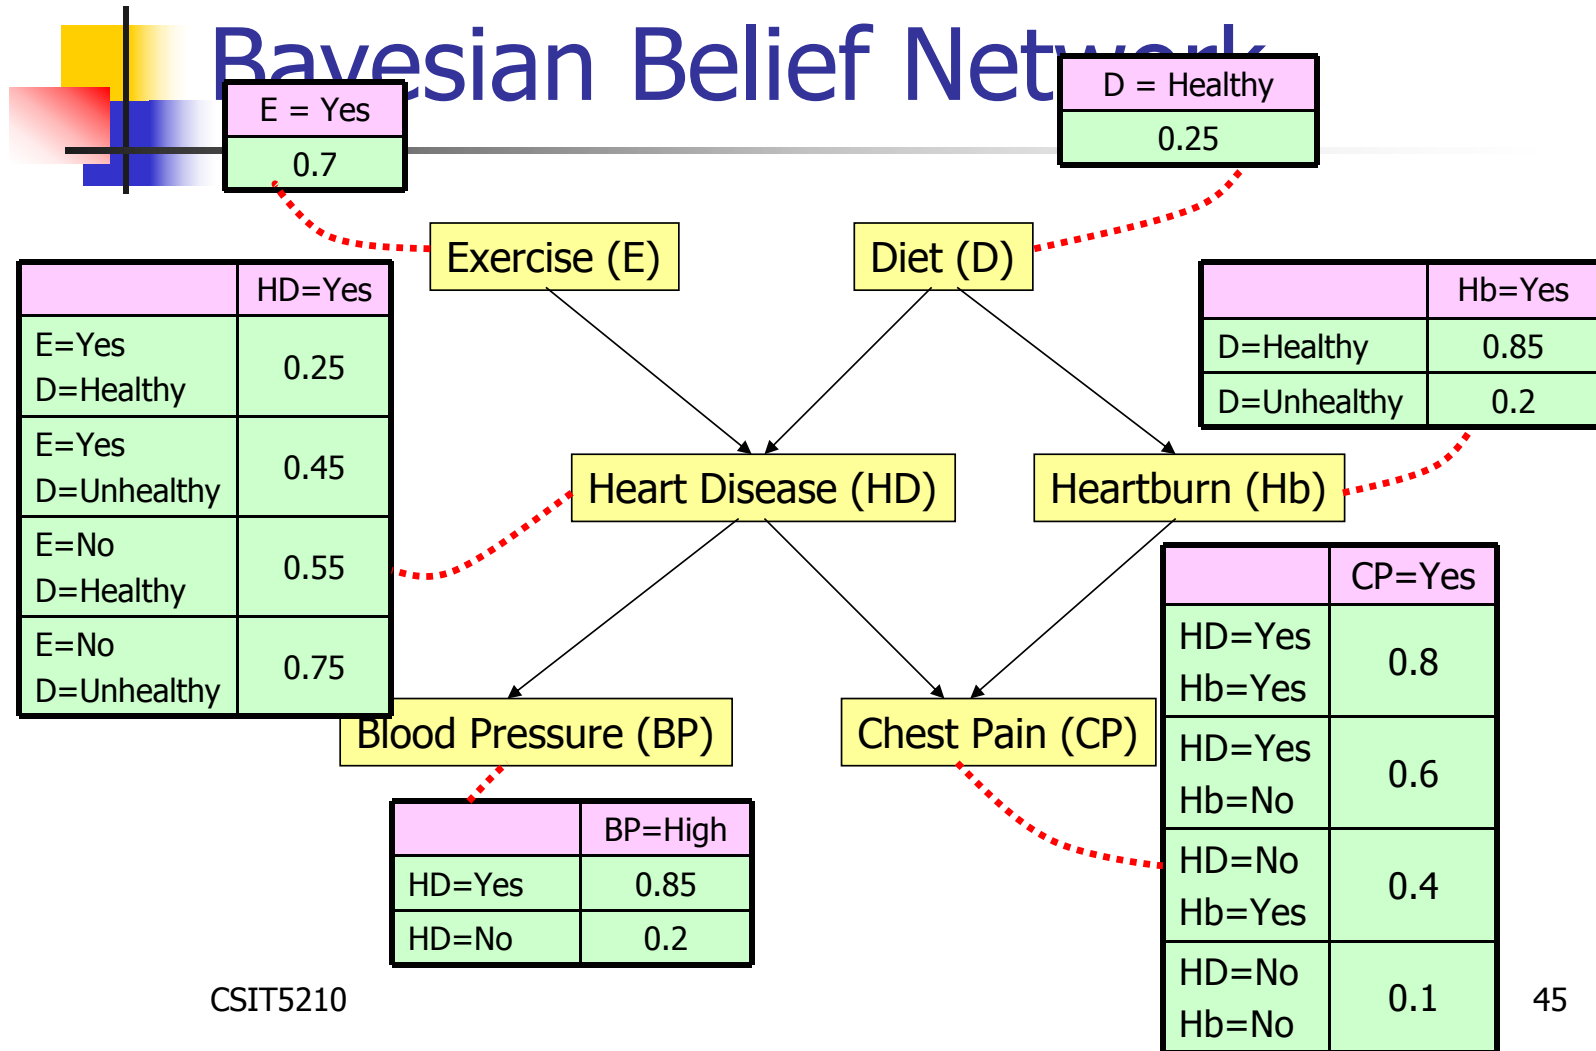

Exercise	Diet	Heartburn	Blood Pressure	Chest Pain	Heart Disease
Yes	Healthy	No	High	Yes	No
No	Unhealthy	Yes	Low	Yes	No
No	Healthy	Yes	High	No	Yes
...	...	...	...	...	...

Some attributes are dependent on other attributes.

e.g., doing exercises may reduce the probability of suffering from Heart Disease

Let  $X, Y, Z$  be three random variables.

$X$  is said to be **conditionally independent** of  $Y$  given  $Z$  if the following holds.

$$P(X \mid Y, Z) = P(X \mid Z)$$

**Lemma:**

If  $X$  is conditionally independent of  $Y$  given  $Z$ ,

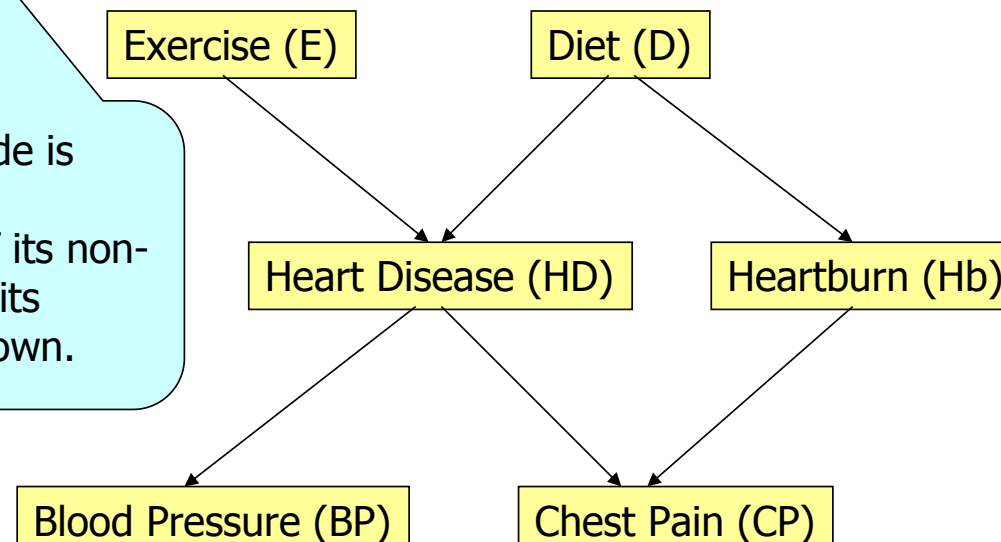

$$P(X, Y \mid Z) = P(X \mid Z) \times P(Y \mid Z) ?$$

Let  $X, Y, Z$  be three random variables.

$X$  is said to be **conditionally independent** of  $Y$  given  $Z$  if the following holds.

$$P(X | Y, Z) = P(X | Z)$$

**Property:** A node is **conditionally independent** of its non-descendants if its parents are known.

e.g.,  $P(\text{BP} = \text{High} \mid \text{HD} = \text{Yes}, \text{D} = \text{Healthy}) = P(\text{BP} = \text{High} \mid \text{HD} = \text{Yes})$

"BP = High" is **conditionally independent** of "D = Healthy" given "HD = Yes"

e.g.,  $P(\text{BP} = \text{High} \mid \text{HD} = \text{Yes}, \text{CP} = \text{Yes}) = P(\text{BP} = \text{High} \mid \text{HD} = \text{Yes})$

"BP = High" is **conditionally independent** of "CP = Yes" given "HD = Yes"

The diagram shows a data table with six columns. Above each column header is a light blue callout bubble containing the possible values for that column:

- Exercise:** Yes/No
- Diet:** Healthy/Unhealthy
- Heartburn:** Yes/No
- Blood Pressure:** High/Low
- Chest Pain:** Yes/No
- Heart Disease:** Yes/No

Exercise	Diet	Heartburn	Blood Pressure	Chest Pain	Heart Disease
Yes	Healthy	No	High	Yes	No
No	Unhealthy	Yes	Low	Yes	No
No	Healthy	Yes	High	No	Yes
...	...	...	...	...	...

Suppose there is a new person and I want to know whether he is likely to have Heart Disease.
